Software Engineer — AI-Driven Automation · Agentic Systems · Full-Stack (TypeScript / Node · Rust · Python)

Engineer who designs and ships AI-driven automation for messy, real-world operational workflows — turning manual, document-heavy processes into agentic systems that run end-to-end. Self-architected and operate a 33-agent production LLM platform, and scoped and designed a six-department AI automation platform for a services business. Full-stack across TypeScript / Node and React, with Rust and Python systems depth and MEV / on-chain R&D; since 2022 (incl. Primavip); pragmatic with LLMs beyond the hype, and rigorous about evaluation, guardrails and measured iteration. Background in law and bank compliance — fluent at connecting technical decisions to business and regulatory outcomes.

Relevant Qualifications

- Claude Certified Associate – Foundations (Anthropic, 2026)
- Rust Programming Specialization incl. LLM Operations (LLMOps) — Coursera / Duke University (2024)
- Self-architected multi-agent AI platform — 33 agents, RAG memory, 45 MCP tools
- Company-wide AI automation platform (6 departments) — scoped & designed for a services operator
- LLB (Hons) Law — Durham University (2010–2013)
- 5 Yrs Corporate Counsel — Access Bank Nigeria (Tier-1) — compliance & data privacy

Core Skills

- **Languages:** TypeScript / JavaScript (Node.js, React), Python, Rust, SQL (Postgres / MySQL), Bash
- **AI & Agentic Systems:** LLM pipelines, multi-agent orchestration, tool / function-calling, prompt design, RAG (Qdrant + embeddings)
- **AI-Assisted Development:** daily driver of Claude Code, Codex CLI, Gemini CLI & Pi across models — agent-in-the-loop coding, review and delivery acceleration
- **Workflow Automation:** multi-channel intake (WhatsApp / email / web), document ingestion & indexing, scheduling, RBAC, audit / logging
- **Full-Stack Web:** Node.js services, React front-ends, REST / webhooks, SQL schema design; ramping tRPC + Drizzle
- **Systems & Data:** high-throughput Rust (Tokio) pipelines, time-series, async services, Redis, Prometheus / Grafana
- **Payments & Integrations:** Stripe, Twilio, WhatsApp Business, OAuth — 30+ third-party integrations
- **Evaluation & Reliability:** decision-logging (JSONL), backtest / live parity, guardrails, fallback chains, metrics-driven iteration
- **Delivery:** end-to-end ownership idea→production, autonomy under ambiguity, compliance & data-privacy (NDPA / GDPR-aware)

Projects and Impact

- **AI Automation Platform for a Multi-Service Operator:**
Scoped, architected and priced a company-wide AI automation platform for a Nigerian multi-service business: six departmental assistants (HR, Operations, Finance, Executive Comms, Procurement / Compliance, Training) on a shared foundation, plus multi-channel customer intake (WhatsApp / phone / email / web), automated job qualification, technician matching and scheduling, status tracking and performance dashboards — with document ingestion / knowledge indexing, role-based access, audit logging and an NDPA data-processing agreement. Maps directly to automating fragmented, manual agency workflows end-to-end.

- **Self-Architected Multi-Agent AI Platform (OpenClaw):**
Designed and operate a production multi-agent AI system — 33 role-specialised agents across 22 workspaces — that routes each task across Anthropic, OpenAI, Google and OpenRouter plus local open-source models (Llama / Qwen / Gemma) through automatic fallback chains for cost and reliability. Built RAG memory over 8 isolated Qdrant vector collections and integrated 45 tool servers with cron-driven pipelines that fan work out to worker sub-agents. Pragmatic, measured use of LLMs to automate real processes — not demos.

- **Full-Stack SaaS Platforms — React + Payments:**
Built and shipped Laravel + React 19 SaaS products serving 1,000+ users with 30+ integrations, including Stripe (payments), Twilio and WhatsApp — full-stack delivery from SQL schema and API to front-end. Directly relevant to Payments and Property-Management workflows.

- **Document AI / OCR and Entity Extraction:**
Built a document-understanding pipeline that ingests PDFs and images, rasterises them, and runs Tesseract OCR plus a local vision-language model (Qwen-VL) and markitdown conversion to read, extract and validate key entities — names, IDs, dates, amounts — from business documents such as statements and certificates, with consistency checks across fields.

- **High-Performance Systems (Rust + Python):**
Designed a 63,110-line Rust ingestion engine (76 async Tokio binaries, time-series partitioning, materialised views, 196 idempotent migrations) tracking real-time prices across 12 APIs; plus a production Python / asyncio arbitrage system with multiple signal detectors, circuit breakers, Redis state and Prometheus observability — reliability-first, every decision metric-gated.

- **Open-Source — architecture-studio (Python):**
Free, self-contained toolkit that turns a one-line design brief into a client-ready package — presentation floor plans, CAD site sheets, photoreal Blender / Cycles renders and valid IFC4 BIM models — no APIs or paid services. Published MIT: github.com/0xNagato/architecture-studio.

- **Background — Law, Banking, Compliance:**
5 years as corporate counsel at a Tier-1 Nigerian bank; LLB (Hons) Durham. Unusually strong on compliance, data privacy and governance, and on connecting technical decisions to business and regulatory outcomes — an asset in regulated domains like Property Management and Payments.
